

SW Team - Definition of Done (DoD) Guideline

Page Content

- [General](#)
- [According to ticket categories](#)

General

Design Review	• Design analysis was performed and approved by the Architect (Unknown User (axehei01))
Code Review	• Code passed the code review (all code must be reviewed, unit tests, integration tests and TA scripts)
Documentation	• For each new header file the doxygen documentation is produced • For each new CAMkES component a wiki article is produced
Repository	• Code is merged into the integration branch (master will follow integration and be update once integration has no regressions)
Tests	• Unit tests are developed and added to the existing ones on the code components which are self-contained enough that not so much mock is needed (in seos_libs few unit tests are developed) • Functionality is demonstrated by integration tests in SEOS tests • Functionality is tested by Test Automation scripts
Continuous Integration	• All the CI pipeline involved are correctly executed CI is green • regressions are well documented in JIRA tickets
Sprint Review	• Prepare the outcome of the ticket, so that you can present it during the Sprint Review Meeting to our stakeholders.

According to ticket categories

Ticket type	DoD template
Bug investigation	• The root cause of the issue is documented in the comments of the ticket • Follow-up tickets to actually fix the issue are created • If partners (e.g., Data61) are involved: ◦ Partners are informed and provided with sufficient information (e.g., example code to reproduce the issue)
Bug fixing/refactoring	• All code/test changes pass the coding style check • All code/test changes are merged to integration • All test systems build successfully on integration • Existing tests run as before on integration • If a bug was fixed: ◦ Regression tests are implemented ◦ All new tests are added to the test plan ◦ All new tests are executed successfully on integration

Implementation of a new (internal) feature	• Feature is implemented • Test cases (good/bad) covering the new feature are implemented • API headers have doxygen documentation added to them • All code/test changes pass the coding style check • All code/test changes are merged to integration • All test systems build successfully on integration • All new tests are added to the test plan • All new tests are executed successfully on integration • Existing tests run as before on integration
Implementation of a new API-level feature /component	• Feature is implemented according to agreed-upon design document • Test cases (good/bad) covering the new feature are implemented • API headers have comprehensive doxygen documentation added to them • A wiki page exists, outlining purpose, requirements, architecture and example code • All code/test changes conform to conventions for API-level code • All code/test changes pass the coding style check • All code/test changes are merged to integration • All test systems build successfully on integration • All new tests are added to the test plan • All new tests are executed successfully on integration • Existing tests run as before on integration
