Scope

Everything in here shall be considered as staging area for the handbook section [seL4 Microkernel and the CAMkES Framework](#). Once stuff is understood well enough, move it over.

FAQ and Notes (Staging Area)

Adding more datatypes as attributes of components

CAMkES currently supports only (signed) ints as data types for integers in the component configuration.

To support our use case with >4GB storage, a patch was created to add "off_t"; the branch is SEOS-1745-storage.

We will reach out to Data61 to figure out, how to proceed with this patch.

seL4NotificationQueue

describe me and add this at [seL4 Microkernel and the CAMkES Framework#Connectors](#)

seL4GlobalAsynchCallback

describe me and add this at [seL4 Microkernel and the CAMkES Framework#Connectors](#)

Single-Threaded components

The file `sel4_global_components/components/modules/single-threaded/camkes-include/camkes-single-threaded.h` defines

```
#define single_threaded_component() \  
    control; \  
    attribute int single_threaded = 1;
```

So a component can be declared as

```
componen foo {  
    single_threaded_component()  
    ...  
}
```

ToDo: check that this really does not generate separate PRC handle threads then ?

Component Header files

- see <https://sel4.systems/Info/CAmkES/Tutorial.pml>

Global components

- see <https://github.com/sel4/global-components>

Language Specific

C

- main language
- in theory things are agnostic of a runtime library, but practically things are married to musllibc, as this is the only lib that is actively used. Some experiments have been done with dietlibc

CakeML

- it's supported, somebody to explore this...

Rust

- it's stuck somewhere in an experimental stage, somebody to try it out

Ada

- there should be no real blocker to make this work, somebody to try it out

Architecture specific

ARM

- nothing special so far

RISC-V

- nothing special so far, works basically like on ARM
- RISC-V support was added with <https://github.com/sel4/camkes-manifest/commit/f839e6fecaeacf865686d3a6fdd7391277fa7463>

x86

- there are no memory mapped peripherals, but I/O ports, so drivers are slightly different
