## Visual Studio Code Extension for CAmkES syntax highlighting

- written in a REGEX dialect called [tmLanguage](#)
- This reuses some parts of the official [Microsoft C syntax extension](#) which is published under the MIT License

## Publishing a newer version to the marketplace

### 1. VSCE package manager (Visual Studio Code Extensions)

In order to be able to interact with the Vscode Marketplace the VSCE package is required.

Nodejs version 14.0.0 or higher is currently required to run vsce. The APT repositories are currently only supporting version 10.0.0 but we can update the version over the npm package manager.

#### Install node vsce

```
sudo apt install nodejs npm
sudo npm install -g n
sudo n stable
sudo npm install vsce
```

### 2. AzureDevOps personal access token

In order to be able to manage extensions on the VSCode Marketplace, a Azure DevOps account is required. This account is tied to Microsoft accounts and does not require additional authentication. The following Microsoft accounts are currently registered as members and administrators of the DevOps organization:

- Thomas Wittal ([Thomas.Wittal@hensoldt-cyber.com](mailto:Thomas.Wittal@hensoldt-cyber.com))
- Matthias Buhl ([Matthias.Buhl@hensoldt.net](mailto:Matthias.Buhl@hensoldt.net))
- Axel Heider ([axel.heider@hensoldt.net](mailto:axel.heider@hensoldt.net))
- Felix Schladt ([felix.schladt@hensoldt.net](mailto:felix.schladt@hensoldt.net))

For publishing with vsce a personal access token from the DevOps project is required:

From your organization's home page (for example: <https://dev.azure.com/vscode-camkes-syntax-highlighting>), open the User settings dropdown menu next to your profile image and select **Personal access tokens**:

[blocked URL](#)

On the **Personal Access Tokens** page, select **New Token** to create a new Personal Access Token and set the following details:

- Give it a Name
- Set Organization to **All accessible organizations**
- Optionally extend its expiration date
- Set Scopes to **Custom defined** and choose the **Marketplace > Manage** scope

[blocked URL](#)

Select **Create** and you'll be presented with your newly created Personal Access Token.

Login to the Market place.

#### Login to the marketplace

```
vsce login hensoldt-cyber-gmbh
```

### 3. Publish the updated version

The issue was reported on github and you merged it into **main**:

After the merge please clone or pull the repo from github.

#### Auto-incrementing the extension version

You can auto-increment an extension's version number when you publish by specifying the [SemVer](#) compatible number to increment: major, minor, or patch.

(Patch increment 1.0.0 1.0.1; Minor increment 1.0.0 1.1.0; Major increment 1.0.0 2.0.0).

For example, if you want to update an extension's version from 1.0.0 to 1.1.0, you would specify `minor` :

#### Publish to the marketplace

```
git clone git@github.com:Hensoldt-Cyber/vscode-CAMkES-highlighting.git
cd vscode-CAMkES-highlighting

vsce publish minor
```
